Dr. Raul Barahona, Coordinator, Entomology Surveillance Unit, Ministry of Health, Honduras: These are poor neighborhoods. There's no running water, they live 5, 6 or 7 families in a room. Dengue is a big problem in the country because we have many cases, many people are dying from that.

Before we came the bottles were without the top now with the program, they use the bottles with the tops so no mosquito can put the eggs inside of it.

The CDC help us educating the team, they gave us equipment and new methodologies and made the people understand more what is important of this program.

People the first time they didn't understand what was important of doing this and now we can see that the people is getting more conscious about the problem. This can help us prevent more dengue and it prevents more people dying.
